How to Setup & Pair CipherLab 156x & 166x Scanners
For iOS, Android or other BT HID Enabled Devices

Please print this document and follow below steps <u>in number order</u>:

1. Scan below barcodes in number order. <u>Ensure you hear the beeper sounds for every scan, also ensure you scan one barcode at a time</u>. If you make a mistake, reinsert the battery into the scanner and start again.

001.Enter Setup

002.Restore Default Settings
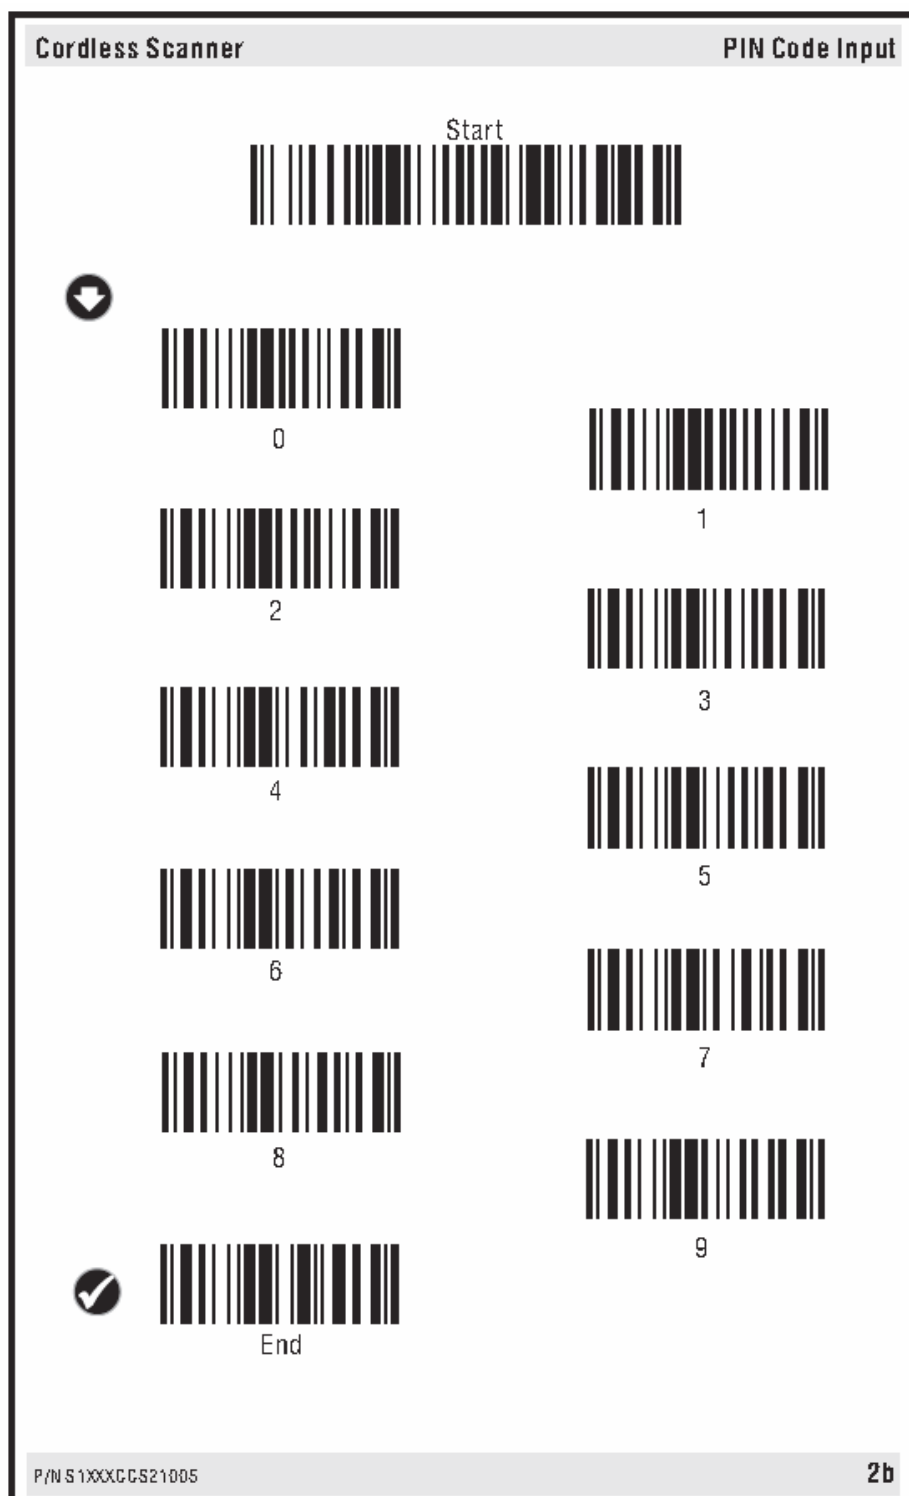

Interface Settings : Bluetooth HID

003.Transmit : By Character

004.Update

2. Open Bluetooth settings on your iOS, Android or whatever device you're pairing the scanner with.
3. Ensure the Bluetooth is searching and when the scanner is found in the list of your device, simply tap on it. It is ideal to keep pressing the scanning trigger of the scanner to keep it awake otherwise it will go on standby after a short time and you will not see it in the Bluetooth list.
4. If your Bluetooth device displays a PIN number to be entered by the scanner, simply scan the PIN via the barcodes below. For example if PIN to be entered is **5543**, scan **START 5 5 4 3 END**

- Any issues? Please follow entire steps above once again. Also check the specs of your BT device to ensure it actually supports BT HID Profile. This is very important.
- Still issues? Have everything handy, batteries fully charged and call us on 02 9621 3377.
